

Law firms offered more cost effective solution for in-house, high volume redaction

New redaction server can process high volumes of mixed documents

LegalTech, New York City, 5 February, 2008 – The new Rapid Redact High Volume Server, released today, gives law firms and corporate counsel a more cost effective option to redact large volumes of documents in-house. Taking greater control of the redaction process can minimize the risks, time and costs involved.

Rapid Redact High Volume Server is the latest product in the Rapid Redact suite, widely used by litigation teams and government departments including the military to efficiently redact documents.

“Advances in e-document discovery (EDD) are resulting in ever increasing volumes of documents submitted for redaction prior to trial,” says Glyn Williams, CEO of Onstream Systems, which develops the Rapid Redact range.

“Redaction is one of the most vulnerable links in the EDD chain and a process that litigators must get right first time. Litigation teams are under intense pressure to meet deadlines and need effective redaction systems to reduce the chance of inadvertently releasing privileged information.”

Rapid Redact High Volume Server allows more document types than ever before to undergo redaction, using unique technology to retain the document fidelity. The Rapid Redact technology translates every document into a uniformly formatted working copy for redaction and subsequent review. The unlimited reviewing capability means that reviewers, who are often senior executives, can now quickly open and approve documents for release, regardless of format. This eliminates bottlenecks during the review process and the need to install expensive proprietary software licences on every reviewer’s PC.

“We’ve responded to demand from litigation teams for a powerful but cost effective server product. High Volume Server gives the legal industry greater choice in their preferred redaction model, confident that it will easily scale to fit any quantity or document type,” says Williams.

High Volume Server’s features include Audit Copies which provide a valuable permanent record of redactions made and a record of the reasons for redaction, including legislated exemption codes.
